

Quick Reference Guide – Adding Default PMPi States

PMP AWAR_xE is configured to integrate PMPInterconnect (PMPi) to expand search capabilities when researching Patient Rx history. You can select from a list of approved states and can configure states to be selected by default when performing patient Rx searches. Please note that the states displayed below may not reflect the states that are available on your account.

Note: Only users with PMPi access will have access to this menu item.

Default InterConnect PMPs

- Arizona
- Colorado
- Connecticut
- Idaho
- Kansas
- Massachusetts
- New York
- Rhode Island
- Tennessee CSMD
- Vermont

Update Defaults

1. Navigate to **Menu > Default PMPi States** (located under User Profile.)
2. A listing of available states is displayed.
 - Available states are dependent on the states' individual configurations and your role. Only states that their role has been granted access to will be displayed.
3. Check the boxes next to the states to be pre-selected when creating each new Patient Rx request.
4. Click "Update Defaults" to save your selections.
5. When the Patient Rx request screen is opened to create a new request, the selected default states will now automatically be checked to include in the search results.
 - You can de-select default states with each search. Setting a state as default does not force the state to be required in patient searches.

Note: It is recommended to mark as default only those states that are commonly significant to your practice. Additional states can be selected based on clinical judgment at time of patient history request
